

Programming Assignment-6

Akanksha Bansal (akankshabansal90@gmail.com)
Gaurav Nanda (gaurav324@gmail.com)
Prateek Agarwal (prat0318@gmail.com)

FSMLite:

java FSMLite.Conform xxx

xxx is expected to be a xxx.state.violet file. Main() method calls the custom written State Parser , converts .violet to .violet.pl . And then adds state.conform.pl constraints at the end of the .violet.pl. Swipl is internally called to validate the constraints and spits out errors if present and exits.

java FSMLite.Convert xxx

It internally calls Conform to validate the .violet file. If correct, it uses 'Convert2Java.vm' to parse the .pl generated to generate .java files.

config.properties

It contains SWIPL path location and has to adjusted as per the user's OS environment.

Running Instructions:

\$ sh ./run.script

This script will compile the code for the above sections and then call functions to generate the java files from the .violet xml given in the argument. The output will indicate if the tests have run successfully or not.
